KNOWLEDGE AND AWARENESS REGARDING THE USE OF CHLORHEXIDINE MOUTHWASH AMONG THE DENTAL STUDENTS

Abhishek N and Jayalakshmi

Saveetha Dental College and Hospitals 162 Poonamalle High road Chennai 600077

INTRODUCTION

A mouthwash is a solution which is used to rinse away food particles and plaque from the teeth. It is used after brushing the teeth and can form part of a daily oral care routine. Mouth rinses are used for a variety of reasons to freshen breath, to help prevent or control tooth decay, to reduce plaque, to prevent or reduce gingivitis to reduce the speed that tartar forms on the teeth, or to produce a combination of these effects. Active ingredients in mouthwash can include thymol, eucalyptol, hexetidine, methyl salicylate, menthol, chlorhexidine gluconate, benzalkonium chloride, cetylpyridinium chloride, methylparaben, hydrogen peroxide, domiphen bromide and sometimes uoride, enzymes and calcium. Ingredients also include water, sweeteners such as sorbitol, sucralose, sodium saccharine, and xylitol. The indications of mouthwashes include: in the treatment of gingivitis, periodontitis, halitosis and in the maintenance of oral hygiene, particularly following periodontal surgery. The most commonly used mouthwash are chlorhexidine, listerine, and triclosan Chlorhexidine is the gold standard mouthwash. It is known for its antimicrobial effect. It acts on the inner cytoplasmic membrane hence it is a membrane active type of substance. It prevents plaque accumulation; hence it is an antiplaque and antigingivitis agent and reduces the adherence of Porphyromonas gingivalis to epithelial cells. It is effective against all the microbes against viruses and fungi also. Although many products have been used to control plaque and gingivitis, chlorhexidine is one of the most widely used anti septics. The major advantages of chlorhexidine over other product is its substantivity, it binds to soft and hard tissues in the mouth enabling it to act for a longer period. It can be bacteriostatic or bactericidal depending on the dose. Listerine is a mixture of three phenolic-derived essential oils—thymol, menthol and eucalyptol—combined with methyl salicylate. The mechanism of action appears to be related to alteration of the bacterial cell wall. This product is uncharged and has a low substantivity.

Triclosan is a chemical used as a preservative as well as to kill or remove bacteria in various products. Products include soaps, natural health products, body washes, shower gels and shampoos, non-prescription drugs such as toothpaste, mouthwash and hand sanitizer.

MATERIALS AND METHODS

This study was conducted online through Survey planet link. The survey consists of 10 multiple-choice questions regarding the use and disadvantages of mouthwash among dental students. The respondents involved in this survey are in range between 18 years old to 25 years old.
dental students in a dental school. A total of 100 respondents had completed this survey. The age of the respondents involved in this survey are in range between 18 years old to 25 years old. Based on the answers provided by the respondents, result was gained to the conclusion and analysis was made by using pie charts for each and every question.

Which mouthwash do you use

![Pie chart showing the distribution of answers for the question about the mouthwash used.

How frequently do you use mouthwash

![Pie chart showing the distribution of answers for the question about the frequency of mouthwash use.

Are you aware about the disadvantages of chlorhexidine mouthwash if yes list out the disadvantages

![Pie chart showing the distribution of answers for the question about the disadvantages of chlorhexidine mouthwash.

Are you aware about the disadvantages of listerine mouthwash if yes list out?

![Pie chart showing the distribution of answers for the question about the disadvantages of listerine mouthwash.

Are you aware about the disadvantages of triclosan mouthwash if yes list out

![Pie chart showing the distribution of answers for the question about the disadvantages of triclosan mouthwash.

Have you heard of mouthwash overdose in children if yes mention the symptoms?

![Pie chart showing the distribution of answers for the question about the symptoms of mouthwash overdose.

Which mouthwash causes alteration in taste sensation?

![Pie chart showing the distribution of answers for the question about the mouthwash that causes alteration in taste sensation.

Which mouthwash do you prefer for patient suffering from burning mouth Syndrome

![Pie chart showing the distribution of answers for the question about the preferred mouthwash for patients with burning mouth syndrome.
DISCUSSION

Continued use of products containing chlorhexidine for long periods can cause stains on teeth, tongue, and gingiva, also on silicate and resin restorations; prolonged use can also reduce bitter and salty taste sensations – this latter symptom can be reversed by ceasing use of chlorhexidine.[1] The brownish discoloration of teeth and tongue is due to the disintegration of bacterial membranes, leading to the denaturation of bacterial proteins.[2] Triclosan has been associated with a higher risk of food allergy.[3]. A Toxicological Sciences study found that triclosan affected estrogen-mediated responses, and many chemicals that imitate estrogen are known to increase breast cancer risk. Triclosan also suppressed thyroid hormone in rats, and this is only one study in an accumulating body of research showing this chemical to be a potent endocrine disrupter.[4] The use of alcohol-containing mouthwash such as Listerine may increase the risk of developing oral cancer.[5]. When ingested in large quantities, the phenolic compounds in mouthwash may contribute to a severe anion-gap metabolic acidosis and osmolar gap, multiorgan system failure, and death. These compounds, in addition to alcohol, may account for the adverse effects associated with massive mouthwash ingestion.[6]

CONCLUSION

From the results it is concluded that the knowledge about the usage of the various mouthwashes is very low. 98 out of the 100 participants said that there is a need for usage of the mouthwash so there is a need for more programs to create awareness and provide knowledge about the usage of the mouthwash among the people for good oral care and a healthy community.
