ABSTRACT

Solar energy is the most promising and vital energy source to produce electricity in a current energy scenario. Photovoltaic cell is a device that converts sun radiation energy (solar energy) into electric energy. When the light fall on the solar panel, it strikes directly to the solar cell, this cell absorbs the solar radiation. These solar cells converts radiation into direct electric current, each photo voltaic cell in the solar panel can generate 0.5 volts of maximum current. The maximum power can be achieved by placing these cells in-series and in-parallel can increase the total current. A good lighting installation is one which makes for good condition of seeing. The ultimate goal of the solar system will be to power the solar LED street lights and tube lights. This type of solar system is very cost effective in a way that it needs little expenditure initially and less maintenance care.

INTRODUCTION

Solar energy is the most demanding energy source due to fact that it is the most abundant and most effective energy source on earth. Solar energy is derived from sun, and this energy is not only environment free but also costless. Latest technology allows the harnessing of solar energy through cells known as solar cells or photovoltaic cells. Photovoltaic cells are placed in direct sunlight, when the direct sunlight hits these cells chemical reaction takes place which produce electric currents [1]. These electric currents are later on converted into electricity which are used to power everyday items like street lights, schools and households. In most of the areas street lights in India receive electrical energy from national grid, so we need to look for another alternative source of electrical power which does not depend on national grid.

For this purpose we use solar energy. LED based lightning system is used which received charge from lead batteries charged by solar panels [2]. Solar system and LED lightning combination enables its interest in governing authorities to lighten street lights and schools in remote areas without setting up any external infrastructure in a meager traditional way. Standalone solar street lightning solutions are popular and usually built with customized PV panels and design [3]. Solar energy systems are also used in schools for lightning purpose, internet installing equipment and laptop charging. This system includes photovoltaic cell, batteries and other connectivity equipment’s [4].

nature. So energy is being obtained from clean energy sources such as wind and solar energies [11]. Solar energy gives direct solution for grid to cut off some loads for stability. One of these loads is street lightning, school lightning especially during summer. This energy provide energy free system where there less or no power from grid [12]. In this paper, we present installation of solar system and its components for streets. Among all of this energy sources we consider solar energy as a best option for continuous electricity. It requires low cost, simple maintenance and initial implementation cost.

Rest of the paper is organized as follows: Section II describes the system model of the proposed design. Installation of solar system is presented in Section III. In Section IV, budget analysis is provided. Finally, the conclusion of the paper is given in Section V.

System Model

In this section, the basic components used in installation of proposed solar system. Description of some of the components like photovoltaic solar panels, batteries, LED lightning, poles, charge controller and inverters are given.

Solar Panels

Solar panels are designed to absorb sun rays as a source of energy for generating electricity and heating. It is also called photovoltaic as it converts light energy directly into electrical energy. Solar panel is made up of solar cells. A large number of small solar cells are spreaded over a large surface area which can work together for provision of sufficient power to be used. Larger the amount of light that falls on a cell, larger is the amount of electricity generated. Two forms of solar panels are used to achieve electricity. The most common is the solar electricity cells. Different design of solar panels which are increasing in popularity are the solar water heating panels which can provide all part of homes hot water supply, heat swimming pools and for other purposes. Using solar electricity panels some form of battery storage is attached to the system [16]. This allows the storage of electricity produced through the day which is used at night (Fig. 1).

LED Light

The solar streets lights are light sources which are powered by photovoltaic panels mounted on lightning structure or integrated itself in the pole. The PV panels charge a rechargeable battery which powers a fluorescent or LED lamp during night. Led lights are usually used for lightning source for modern solar light. These lights provide much higher lumens with lower energy consumption. LED lights give energy consumption up to 50 percent lower than high pressure sodium lamp (HPS) which is widely used as lightning source in traditional street lights. The LEDs lack of warm up time also allows motion detectors for additional gain of efficiency [16] (Fig. 2).

Batteries

Batteries are the most important component in the installation of solar system. Batteries store electricity from solar panels during day time and deliver this energy to the fixture during night. The life cycle of battery is very important to the lifetime of light and capacity of battery will affect the backup days of the lights. Two types of batteries are usually used which are Gel Cell Deep Cycle battery and Lead Acid Battery and many more. During charging time, electrical energy is converted into chemical energy and stored in the form of chemical energy and during discharging time the chemical energy is converted into electrical energy. The proper selection of batteries for PV systems depends upon the best knowledge of their design features, operational requirements and performance characteristics. Batteries are manufacture by the combination of different sequential and parallel processes. Conduction of charging and discharging cycles on batteries are done necessarily before bringing them to the market for distribution to consumers. Important components of batteries are cells, active element, electrolyte, grid plate, separator, terminal posts, cell events and case [16] (Fig. 3).
Charge Controller

A charge controller is an essential part of nearly all power systems that charge batteries. It is also very important for solar street lights and school lightning system. Controllers usually decide to switch on/off charging and lights. The function of charge controller is quite simple, it blocks the reverse current and prevents battery from overcharging. Some charge controllers also prevent battery from over discharge, protect from electrical overload and display battery status and power flow. The PV panels works by pumping electric current to the battery in one direction. At night PV panels pass a little bit current in the reverse direction, causing a slight discharge from battery. The potential loss is minor but it can easily be prevented. Different types of wind turbine and hydro generators also draw reverse current when they are stop. In most charge controllers current passes through semiconductor, which acts like a valve to control current. This is known as semiconductor because current passes only in one direction. This prevents reverse current without any extra effort or cost [16] (Fig. 4).

Pole

Each street light contains its own photovoltaic panel, independent from other street lights. Number of panels is installed as a central power source on a separate location which supplies power to number of street lights. Pole Lock is designed for pole mounted solar panel framing system which is a component of Sun Lock family of solar framing products. Many types of frames are assessable for two small panels i.e., 80 W and 85 W panels [16]. They are also obtainable for one, two, three or more larger panels i.e., for 250 W or more (Fig. 5).

Inverters

Solar inverter is the important component in solar energy system. It converts DC output power into AC current which is fed into grid and directly influences the reliability and efficiency of solar energy system. Mostly 220v AC and 110v AC are needed for power supply because direct output from solar system is usually 12v DC, 24v DC or 48v DC. For this purpose there is a need of DC-AC inverter in order to supply power of 220v AC to electronic devices. Inverters are usually rated by the amount of AC power that can supply continuously. The manufacturers provide 5 second and hour surge figures which is able to give indication of how much power is supplied by the inverters. Large number of inverters is used in power application. They are also referred to as a voltage source inverters (VSI). In grid interconnected PV power system DC output power of photovoltaic array is converted into AC power of the utility power system [16]. Below this condition an inverter convert DC power into AC power is required. In solar panels, core technology is associated with these systems is a power conditioning unit (inverter) which convert solar output electricity attuned with the grid (Fig. 6).

Installation of Solar System

In this section whole solar system for street lights are described. We mainly focus on our project constraints, sizing array, battery array, and cost of the projects, number of poles used and site of system integration (Fig. 7).

Basic Requirement

This project gives cheap and easy power to street lights to different areas. The system requires low fixed cost, easily installed and reliable. The project gives great idea to install street lights in such areas where there is no light or less power. The above figure represent block diagram. The DC source can be further converted back to AC to use some AC load.
Design Of Street Lights Powered By Solar Power System

Collecting Data

This work presents an independent street lightning system positioned on solar energy as a primary source and batteries as a secondary source, lighting emitting diodes (LEDs) as a lighting source. This system is also proposed for remote areas like roads and cross roads. Furthermore, it is highly efficient because all power stages are implemented in DC current. The architecture of LEDs fixture, in order to compensate a 70 W high pressure sodium (HPS) lamp, is performed. The solar system for streets lights improve the life style of peoples, prevents robberies and literacy in these areas. We visited different areas and collecting data regarding total number of solar street lights poles. We finally summarized and calculated the combine data of solar street lights pole in which solar system is installed.

Energy Calculations: In this section we shall calculate generalized form of energy.

Total number of solar street poles = 25
One LED frame load = 12watt
One solar street pole wattage = 12watt
Total number of pole wattage = 25 * 12 = 300watt

Daily solar LED energy units used at night 300*10 = 3kwhr
Where 10 is the total number of hours in which solar LED is used. Similarly if we calculate load for 1 week. Solar LED energy units used in 1 week 300 * 70 = 21kwhr.

Balance of System Design

It illustrates the basic design of our system which includes mounting of solar street panels, wiring in system and system equipment.

Solar panels array: The wiring of solar system is made in such a way that solar system is separated from each street light to provide power to huddle of street lights.

1. The PV array gives us the ability to sculpt unlimited solar panels individually or in groups to connect them in series or parallel combination to form solar array.
2. Poles directly mounted into the ground or fixed in concrete.
3. Ground work mounts, such as concrete slabs or poured footings.
4. Ballasted foot mounts i.e., concrete or steel based that use weight to sheltered solar module system in position do not required ground penetration.
5. Pole mounts which are directly attached to the roof structure used additional rails for attaching frames or module racking.

Wiring: Wiring of the system can be made by the position of the components. The panels are placed parallel to the ground and the wiring is done in such a way that could be simple and easy to understand. The infrastructure like poles and wiring are not replaced to lodge because the system has no similar constraint as standalone system. The end result is that the system can be intended as big as required with the sufficient batteries and solar panels to supply enough power to the LED lights. The batteries of the system are kept in a cabinet where it is insulated to give maximum power protection against heat. A monitoring device is equipped with the system which alerts the authorities of any tampering or removal of equipment from the system. Due to this device the threat of theft will not eliminate but reduce time to catch culprits red handed. The wiring and maintenance is done at one point for several lights and combined with the monitoring system. The maintenance is done on system from the central computer [16].

Budget Analysis

In this section, we discussed the final execution of our project which includes civil work combination, possession of solar components and the total cost of the project. In start large expenditure is needed for LED and PV solution, however excavating work for power wires and energy expenses are not useful. The extravagant sustenance work can be lessen with the help of long LED lifetime causing profit by LED over usual lighting. Several stages of our system installation occur. All the members of our team work hard. We predict after purchasing LED lights, street light pole, batteries, wiring, charge controller and system tools to be purchased to the area. While completing our system components we shall calculate our skilled workers per person labour charges. After all this, we shall implement our solar street lights system. All these system components are shifted to the site by road transportation. Total cost for installing single standalone pole powered with solar is also shown in Table 1.

CONCLUSION

In this paper, we install solar system and its components for street lights. The system we provide gives electricity to street lights to prevent accident, robberies and safety at night remove educational literacy and improve human life style. We also presented the complete analysis of our project regarding initial cost, including LED lights, street light poles, batteries, inverter, its installation and transportation cost. Such solar system project requires low initial cost, less maintenance and more economical.
