# CONSTRUCTION OF NEIGHBOURLY IRREGULAR CHEMICAL GRAPHS AMONG s-BLOCK AND p - BLOCK ELEMENTS COMBINATIONSAND ITS SIZE 

## Arockia Aruldoss J and Gnana Soundari S

PG \& Research Department of Mathematics, St. Joseph's College of Arts and Science (Autonomous), Cuddalore-1

ABSTRACT
A connected graph $G$ is said to be neighbourly irregular, if no two adjacent vertices of $G$ have the same degree. Given a positive integer $n$ and a partition $n$ with distinct parts. In this paper, we could derive some Neighbourly Irregular Chemical Graph (NICG) of molecular structure which is derived from the s-block elements and p-block elements combinations in the area of Inorganic Chemistry. Considering the atom as vertices, covalent bond as edges, and valence as degree of vertices. Also I have derived the size of such Neighbourly Irregular Chemical Graph (NICG).

## Keywords:

Regular graph, irregular graph, Highly Irregular Graphs, Neighbourly irregular graph, Neighbourly irregular chemical graph, Molecular structure, Atoms, Valence of Atoms and Covalent Bond.

## Introduction

By a graph G we mean a finite undirected, connected graph without loops or multiple edges. In graph theory, regular graphs are those graph for which each vertex has the same degree. There are plenty of regular graphs, for example, complete graph. The problem arises when a graph is not regular. If it is irregular, how much of irregularity is thrust upon its vertices? A connected graph $G$ is said to be highly irregular if each neighbour of any vertex has different degree. A connected graph $G$ is said to be a k-neighbourhood regular graph if each of its vertices is adjacent to exactly $k$ vertices of the same degree (If $k=1$, it becomes a highly irregular graph)
Inspired by the work of Dr. S.GNANA BHRAGASAM, we define the concept of Neighbourly Irregular Chemical Graph abbreviated ad NIC Graphs.

| Chemical term | Mathematical (graph-theoretical) term |
| :--- | :--- |
| Atom | Vertex |
| Molecule | Molecular graph |
| Covalent bond | Edge |
| Acyclic hydrocarbon | Tree |
| Alternant structure | bipartite Graph |
| Valence of a atom | Vertex degree (number of lines at that vertex) |
| Skeletal structure | Hydrogen-depleted graph |
| Number of rings | Cyclamate number |
| [n] Annulene | n-vertex cycle |
| Huckel theory | Spectral theory |
| Topological matrix | Adjacency matrix |
| Energy level | Eigenvalue |
| Nonbonding level | Zero eigenvalue |
| Bonding level | Negative eigenvalue |
| Antibonding level | Positive eigenvalue |
| Secular polynomial | Characteristic polynomial |
| Kekule resonance formula | Perfect matching, 1- factor |

## Definitions

Regular Graphs: In a connected graph $G$ is said to be regular graph for which each vertex has same degree.

Irregular Graphs: A graph $G$ is called irregular graph, if there is a vertex which is adjacent only to vertices with distinct degrees.

Neighbourly Irregular Graphs: A connected graph G is said to be neighbourly irregular Graph (NIG) if no two adjacent vertices of G have the same degree. NI graph where as it is not a k - neighbourhood regular graph.

k- neighbourhood
The graph is a 2-neighbourhood regular graph but not a NI graph

## 2-neighbourhood

Neighbourly Irregular Chemical Graphs (NICG): A graph is said to be a Neighbourly Irregular Chemical Graph (NICG) for the molecular structure of corresponding element of the atoms has different valency bond in its adjacent atoms.

Aluminium Borohydride $\left(\mathrm{AlB}_{3} \mathrm{H}_{12}\right)$

ACT-1: If $v$ is a vertex of maximum degree in a NIC graph, then at least two of the adjacent vertices of v have the same degree.

Proof: Let v be a vertex of maximum degree $\Delta$. Let $\mathrm{v}_{1}, \mathrm{v}_{2}$ ,$\ldots \ldots \ldots . \mathrm{v}_{\Delta}$ be the vertices adjacent to V . If their degrees are distinct, then there is one vertex, $\mathrm{v}_{\mathrm{i}}$ such that $\operatorname{deg}\left(\mathrm{v}_{\mathrm{i}}\right)=\Delta=\operatorname{deg}$ (v) which contradicts the neighbourly irregularness of the graph.

FACT-2: $\mathrm{K}_{\mathrm{m}, \mathrm{n}}$ is NICG if and only if $\mathrm{m} \neq \mathrm{n}$.

$\mathrm{m}=5, \mathrm{n}=4 \Rightarrow \mathrm{~m} \neq \mathrm{n}$

Derive from the molecular Structure of Hydroxylamine (NH $\left.{ }_{3} \mathrm{O}\right)$

FACT-3: Let G be a NIC graph of order n . Then for any positive integer $\mathrm{m}<\mathrm{n}$, there exist at most m vertices of degree $(n-m)$ for, if $G$ has $(m+1)$ vertices of degree ( $n-m$ ), then due to their non adjacency nature, there must be at least $\mathrm{m}+1+\mathrm{n}-\mathrm{m}$ vertices that is $(\mathrm{n}+1)$ vertices contradicting the order of G .

Proof
Let G be a NIC graph of order $\mathrm{n}=7$, then any positive integer $\mathrm{m}<\mathrm{n}$

Methylamine $\left(\mathrm{CH}_{5}\right)$
Fact-4: If a graph G is NIC, then $G^{C}$ is not NIC
Proof: By fact -1 there are two nonadjacent vertices of same degree I in G. Those vertices are then adjacent vertices and also of same degree $n-1-1$ in $G^{C}$

NIC

Theorem 1: Any graph of order n can be made to be an induced sub graph of a NIC graph of order at most $n+1 C_{2}$

Proof: Choose any two adjacent vertices of G. If they are of same degree, introduce a new vertex. This process is repeated
pairwise inductively till no two adjacent vertices are of same degree.

As it involves at most $\mathrm{nC}_{2}$ steps only, the order of the induced NIC graph is $\mathrm{n}+\mathrm{nC}_{2}=\mathrm{n}+1 \mathrm{C}_{2}$.
The induced NIC graph of $\mathrm{K}_{4}$ are given below.

$\longrightarrow$
$\qquad$

(Diborane $\mathbf{B}_{2} \mathbf{H}_{6}$ )

Sum of NIC Graph of
$\mathrm{K}_{4}$ is $\mathrm{n}+\mathrm{nC}_{2}=(\mathrm{n}+1) \mathrm{C}_{2}$

$$
\begin{aligned}
4+4 \mathrm{C}_{2} & =(4+1) \mathrm{C}_{2} \\
4+6 & =10 \\
10 & =10
\end{aligned}
$$

Theorem 2: Given a positive integer n and a partition
$\left(n_{1}, n_{2}, \ldots \ldots . . n_{k}\right)$ of $n$ such that all $n_{i} s$ are distinct, there exists a
NIC graph of order $n$ and size

$$
\frac{1}{2}\left\{\mathrm{n}^{2}-\left[\mathrm{n}_{1}^{2}+\mathrm{n}_{2}^{2}+\ldots \ldots \ldots \mathrm{n}_{\mathrm{k}}^{2}\right]\right\}
$$

Proof: The required NIC graph is constructed follows. The $n$ vertices are partitioned into $k$ sets. The first set consists of $n_{1}$
vertices $\mathrm{u}_{1}, \mathrm{u}_{2}$ $\qquad$ $\mathrm{u}_{\mathrm{n} 1}$ the second consists of $\mathrm{n}_{2}$ vertices $\mathrm{v}_{1}, \mathrm{v}_{2}, \ldots \ldots . \mathrm{v}_{\mathrm{n} 2}$ and vertices $\mathrm{z}_{1}, \mathrm{z}_{2}, \ldots \ldots . \mathrm{z}_{\mathrm{k}}$. Then every vertex in the first set is joined to all the other vertices in the remaining (k-1) sets. Similarly each vertex in the remaining set are joined set all those vertices in the other remaining sets. The vertices in the same set are non-adjacent. Therefore, degree of each vertex in the set in $n-n_{j}$. As all the $n_{i} \cdot s$ are distinct, the connected graph so constructed is NIC and it is denoted by NIC $\mathrm{n}_{1}{ }^{2}+\mathrm{n}_{2}{ }^{2}+$ $\qquad$ . $\mathrm{n}_{\mathrm{k}}{ }^{2}$.

The size of the graph $=\frac{1}{2} \sum$ deg v

$$
=\frac{1}{2} \sum_{\mathrm{j}=1}^{\mathrm{k}} \mathrm{ni}\left(\mathrm{n}-\mathrm{n}_{\mathrm{i}}\right)=\frac{1}{2}\left[\mathrm{n}^{2}-\left(\mathrm{n}_{1}^{2}+\mathrm{n}_{2}{ }^{2}+\ldots \ldots \ldots . \mathrm{n}_{\mathrm{k}}^{2}\right)\right]
$$

Eg:
For $\mathrm{n}=11$ and the partition $(2,1,2,1,2,3)$ of 11 , the graph $\mathrm{NIC}_{(2,1,2,1,2,3)}$ is as shown below]

Berlium borohydride $\left(\mathrm{Be}\left(\mathrm{BH}_{4}\right)_{2}\right)$

## Size of graph

The maximum size of such a NIC graph of order 11 is

$$
\begin{aligned}
& =\frac{1}{2}\left[\mathrm{n}^{2}-\left(\mathrm{n}^{2}{ }_{1}+\mathrm{n}_{2}{ }^{2}+\ldots \ldots \ldots \ldots+\mathrm{n}_{\mathrm{k}}{ }_{\mathrm{k}}\right)\right] \\
& =\frac{1}{2}\left[11^{2}-\left(2^{2}+1^{2}+2^{2}+1^{2}+2^{2}+3^{2}\right)\right] \\
& =\frac{1}{2}(121-23) \\
& =\frac{1}{2} \mathrm{x} 98 \\
& =49
\end{aligned}
$$

The minimum size of NIC Graph of order 11 in .
$=\mathrm{n}_{1}{ }^{2}+\mathrm{n}^{2}{ }_{2}+\ldots \ldots \ldots+\mathrm{n}_{\mathrm{k}}{ }^{2}$ is minimum
$=2^{2}+1^{2}+2^{2}+1^{2}+2^{2}+3^{2}$
$=23$ is minimum

## Lemma1.1

If $\left(m_{1}, m_{2}, \ldots, m_{r}\right)$ and $\left(n_{1}, n_{2}, \ldots ., n_{k}\right)$ are two partitions of a positive integer n with $\mathrm{r}<\mathrm{k}$, then $\mathrm{m}_{1}^{2}+\mathrm{m}_{2}^{2}+\ldots . .+\mathrm{m}_{\mathrm{r}}^{2}>$ $\mathrm{n}^{2}{ }_{1}+\mathrm{n}_{2}{ }^{2}+\ldots \ldots \ldots \ldots+\mathrm{n}^{2}$ k.
Proof : This is proved by induction on $n$. Assuming up to $n$, take two partitions $\left(\mathrm{m}_{1}, \mathrm{~m}_{2}, \ldots, \mathrm{~m}_{\mathrm{r}}\right)$ and $\left(\mathrm{n}_{1}, \mathrm{n}_{2}, \ldots, \mathrm{n}_{\mathrm{r}}\right)$ of the positive integer ( $\mathrm{n}+1$ ).
i.e., $\mathrm{m}_{1}+\mathrm{m}_{2}+\ldots \ldots+\mathrm{m}_{\mathrm{r}}=\mathrm{n}+1=\mathrm{n}_{1}+\mathrm{n}_{2}+\ldots .,+\mathrm{n}_{\mathrm{k}}$

Let $i$ and $j$ be the first indices of $m_{i}$ 's and $n_{j}$ 's and respectively such that $m_{i} \geq n_{j}$. Now, If ( $\left.m_{1}, m_{2}, \ldots, m_{i}-1, \ldots m_{r}\right)$ and
$\left(\mathrm{n}_{1}, \mathrm{n}_{2}, \ldots . \mathrm{n}_{\mathrm{j}-1, \ldots} \ldots, \mathrm{n}_{\mathrm{k}}\right)$ are two partitions of n with $\mathrm{r}<\mathrm{k}$. Applying the induction, we have $\mathrm{m}_{1}^{2}+\mathrm{m}_{2}^{2}+\ldots \ldots+\left(\mathrm{m}_{\mathrm{i}}^{2}-1\right)^{2} \ldots \ldots .+\mathrm{m}_{\mathrm{r}}^{2}$
$>\mathrm{n}^{2}{ }_{1}+\mathrm{n}_{2}{ }^{2}+\ldots \ldots . .\left(\mathrm{n}_{\mathrm{j}}-1\right)^{2} \ldots \ldots+\mathrm{n}^{2}{ }_{\mathrm{k}}$
(i.e.) $\mathrm{m}_{1}{ }^{2}+\mathrm{m}_{2}^{2}+\ldots \ldots+\mathrm{m}_{\mathrm{i}}^{2} \ldots \ldots .+\mathrm{m}_{\mathrm{r}}{ }^{2}-2 \mathrm{~m}_{\mathrm{i}}$
$>\mathrm{n}^{2}{ }_{1}+\mathrm{n}_{2}{ }^{2}+\ldots \ldots \ldots+\mathrm{n}_{\mathrm{k}}{ }^{2}+\ldots \ldots+\mathrm{n}_{\mathrm{k} .}^{2}-2 \mathrm{n}_{\mathrm{j}}$
(i.e) $\mathrm{m}_{1}{ }^{2}+\mathrm{m}_{2}{ }^{2}+\ldots \ldots+\mathrm{m}_{\mathrm{i}}{ }^{2}>\mathrm{n}^{2}{ }_{1}+\mathrm{n}_{2}{ }^{2}+\ldots \ldots . .+\mathrm{n}_{\mathrm{k}}{ }^{2}+2\left(\mathrm{~m}_{\mathrm{i}}-\mathrm{n}_{\mathrm{j}}\right)>$ $\mathrm{n}^{2}{ }_{1}+\mathrm{n}_{2}{ }^{2}+\ldots \ldots \ldots+\mathrm{n}_{\mathrm{k}}{ }^{2}$ as $\mathrm{m}_{\mathrm{i}}>\mathrm{n}_{\mathrm{j}}$
This proves the lemma.
Corollary: Actual partition of $n$ for which $\operatorname{NIC}_{( } \mathrm{n}_{1}+\mathrm{n}_{2}+\ldots \ldots \ldots \mathrm{n}_{\mathrm{K})}$ is of maximum size is given by $\{$ $2,3,2, \ldots,, r-, r+1, \ldots . \mathrm{k}\}$ where k is the least positive integer such that $\frac{\mathrm{k}(\mathrm{k}+1)}{2}>\mathrm{n}$ and $\mathrm{r}=\frac{\mathrm{k}(\mathrm{k}+1)}{2}-\mathrm{n}$.
Proof: If there exists a least positive integer k such that $\mathrm{n}=\frac{\mathrm{k}(\mathrm{k}+1)}{2}$ then $(1,2, \ldots \ldots . \mathrm{r}-1, \mathrm{r}+1, \ldots . \mathrm{n})$ \{where $\mathrm{r}=$ $\left.\frac{k(k+1)}{2}-n\right\}$ is the partition of $n$ of maximum number of parts and so the results is true by lemma Illustrations - for n $=7$ the partition $(2,3,2)$ gives the maximum size and the NIC $(2,3,2)$ graph is

(Methlamine $\mathrm{CH}_{5}$ )
Size $\begin{aligned} & =\frac{1}{2}\left[7^{2}-\left(1^{2}+2^{2}+4^{2}\right)\right] \\ & =\frac{1}{2} \times 28 \\ & =14\end{aligned}$

## Conclusion

In this paper we have constructer Neighbourly Irregular Chemical Graph(NICG) amongs-block elements and p-block elements combinations and its size in inorganic chemistry.
